

About Georgia Transmission Corporation (GTC)

- Transmission-only, not-for-profit cooperative
- Formed in March 1997 from the restructuring of Oglethorpe Power Corporation (OPC)
 - GTC provides network transmission services to 38 Member EMCs in Georgia
 - GTC provides point-to-point service to other customers

GTC Overview – System Assets

Transmission Lines

46 kV lines	275 miles
69 kV lines	14 miles
115 kV lines	1,132 miles
230 kV lines	1,274 miles
<u>500 kV lines</u>	<u>477 miles</u>
<i>Total lines</i>	<i>3,172 miles</i>

Substations

Transmission substations	91
<u>Distribution substations</u>	<u>569</u>
<i>Total substations</i>	<i>660</i>

Georgia ITS

- GTC owns more than 3,100 miles of transmission lines
- GTC has access to more than 17,000 miles of transmission lines in Georgia through the Georgia Integrated Transmission System (ITS)
 - Assets owned by GTC, Georgia Power, MEAG Power and Dalton Utilities

GTC Functional Areas

Planning

- Bulk System Planning
- Member Planning
- Area Planning
- System Protection & Control

Engineering & Construction

- Substation and T/L Design
- Relay/Control Design
- Transmission Projects
- Land Services
- Environmental
- Construction Inspection

Maintenance

- Substation Maintenance
- Transmission Line Maintenance
- Electronics Maintenance
- Relay Maintenance
- Cyber Operations

Support

- System Services
- Reliability
- Finance, Treasury, Administration, Legal
- Procurement
- External Affairs
- Audit/Compliance
- Human Resources
- Safety/Training
- Project Reporting

GTC Goals for the PQ Dashboard Project (DFR)

1. Use the PQ Dashboard, with records from the Digital Fault Recorders (DFR), to look at non-trip events that were recorded (Voltage and Current Sags and Swells)
2. Using DFR data to perform automatic double ended fault location calculations and send out email
3. Using the DFR data to monitor breaker trip times and send out notifications for slow operating breakers

openXDA/PQ Dashboard Server and Database Configuration

DFR Server

- Digital Fault Recorder data is pushed to the Web Server by PeerSync software

Web Server and Database Server

- Contains all the pushed DFR Event data; COMTRADE and Line Configuration files
- File Watcher program looks for new files to process
- openXDA program analyzes the file data and updates the database with calculations
- openXDA Database is Microsoft SQL Server

PQ Dashboard

- Event data and calculations are displayed in the PQ Dashboard which runs in a browser
- Select group of individuals receive Fault notification emails

Breaker Timing

Breaker Timing

Things we had to do to apply the PQ Dashboard

1. Worked with USI and APP to modify the line files. Added the breaker number in order to link to MAXIMO.
2. Cleaned up line file numbers in the DFRs to match the STOMP data base. Lots of files were brought up to date.
3. Added non-line breakers to the DFR line files for breaker timing.
4. Large data clean up effort with the MAXIMO data. Added breaker operate time to data base.
5. Created a database with thermal line rating for each line.

2016 and Beyond

1. Geographic enhancements and reporting (GIS)
 - Show T/L with fault location, lightning location, and other information
2. Event correlation with lightning
3. Incorporate Fault Indicator data
4. Add GTC Power Quality meters to the dashboard
5. Additional breaker analytics and reporting
6. Add functions to the PQ Dashboard such as Event Reclassification and Tagging
7. Identification and reporting of out of service DFRs and Power Quality meters
